**Results (cont.)**

- The 30 day mortality rate was 5.8% which equates to 3 patients. 2 of these patients had a general anaesthetic and all 3 patients had complications 30 days post operatively all of which were related to infection. 1 patient also had to have a revision 30 days post operatively.
- 57.7% (30 patients) had at least 1 complication within 30 days of the operation. 24 had 1 complication and 6 patients had more than one complications (Fig 3)
- 22 patients had no post-operative complications 30 days post surgery
- Majority of complications were respiratory related and most of these were a lower respiratory tract infection (Fig 4). 8 patients had to have a revision of their amputation within 30 days post operatively.
